

Radcon Formula #7 for lifetime waterproofing!

A sewage plant is an excellent application for Radcon Formula #7 to waterproof the concrete tanks.

Formula #7 is not a new kid on the block!

Formula #7 has been around for over 25 years, but has only in the recent past been recognized in the USA for its outstanding performance capability. Only in the past couple of years have consultants, architects and owners learned the true capability of Formula #7. And this knowledge is just in time as more and more people realize that the planned life cycle for concrete is not what it should be. Other countries have a design life of 100 years for their structures and yet we see concrete failures requiring replacement in one third to one half this length of time. The life of concrete is frequently shortened due to lack of protection for the concrete and the reinforcing. With tax dollars becoming tighter it only makes sense to invest wisely in preserving our concrete infrastructure.

Preservation is the new paradigm

Concrete has been around for centuries and it still cracks. Today's concrete formula's have changed over the past couple of decades and we have seen more cracking occurring. Formula #7 addresses the cracking problem as it can seal

cracks up to 2 mm wide and will seal hairline cracks that open up in the future.

FORMULA #7 is suitable for potable water systems for tanks and any concrete structure containing water or sewage.

Shown here are a few regional applications of Formulas #7 recently completed.

To learn more about the many benefits of FORMULA #7 please call **Express Polymers, Inc** at **888.433.6922**. We are your source for outstanding concrete construction and preservation products.
