

Mender and Mender Blender a winning duo!

Until now there has been a concern on the part of some users of Mender with the color change that can occur under UV light. This concern has been minimized with the advent of MENDER BLENDER. This water based cement coating system is extraordinary in many respects. Certainly performance is the key to its growing popularity. It can be used to cover Mender repairs and cover entire sections or steps to make them look like a new section of concrete has been placed. It is not as fast as Mender, but it is fast enough that you can put foot traffic on the repair in a couple of hours depending on temperatures and wind conditions. Take a look at this one, two, three step repair completed in minutes for a residential complex.

1. As in the photo below you must first remove the loose materials and make sure you have a sound substrate. Remember what the dentist is looking for – a good foundation before he begins filling.

2. Once the repair area is clean you can begin inserting Mender and dry silica sand and finish off the surface flush with the surrounding concrete. A little sand on the surface is good to enable bonding the

Mender Blender coating that will be applied on top.

3. Within a few minutes you can begin applying the Mender Blender to the surface repair and surrounding area. After mixing the Mender Blender apply it thinly to the surface that you want to cover. Adjust the surface to match the surrounding concrete. And you have an attractive finished step in minutes that is practical and long lasting.

To learn more about the many benefits of **Mender and Mender Blender** please call **Express Polymers, Inc** at **888.433.6922**. We are your source for outstanding concrete repair and preservation products.
